

Load shedding is compromising your home security this festive season

12 Dec 2023

Whether you're setting off on vacation or going on a day trip with friends or family this festive season, you'll want peace of mind that your home is safe. Unfortunately, that's made all the more difficult when your security cameras, alarm system, and indoor and outdoor lights are left inoperative due to load shedding.

Source: Supplied.

There's no telling whether and how much electricity we'll have this December period. Criminals are well aware that many of us will be out for a few days, and that most security systems go down the moment load shedding begins.

A solar system with panels, an inverter, and batteries, all tailored to your home's specific security and everyday needs, resolves many of the security concerns we as homeowners may have while we're away, especially during times of heavy load shedding.

While you plan for your festive-season security needs before setting off, there are a few security benefits to having solar that you should consider:

- **Exterior lights for increased outdoor visibility:** Outdoor lights connected to your solar-energy system can provide increased visibility around your property throughout the night. These will also assist some of your other security systems or guard dogs by providing increased visibility during nighttime load shedding.

Some criminals monitor their targets before breaking in to gauge movement. Exterior lights that are left on at all hours of the day may indicate that no one is home. Connecting these lights to a timer or a remote-control system, which is also connected to the internet, will allow you to control your lights while away, even during load shedding, ensuring that they're on at night, and off during the day.

Alumo Energy's solar systems, installed by expert and experienced solar engineers, could be set up in such a way that specific lights and other security systems in different parts of the home are prioritised and are always provided with a steady stream of electricity.

- **Devices that imitate interior activity:** Similar to exterior lights, interior lighting may indicate to criminals that someone is home. By connecting certain indoor light fixtures to the solar system, you can ensure that they stay on during load shedding.

A worthwhile addition would be remote-controlled fixtures that connect via the internet to your smart device, which will allow you to turn specific lights in separate parts of your home on and off to make it seem as though there is human activity inside.

LEO satellites are the future of connectivity in the digital economy

Your festive lights can also be connected to the solar-energy system, creating the impression that your family is spending this period at home. As an added benefit, solar power will help offset the additional electricity costs that come with running multiple festive lights, saving a considerable amount on your electricity bill over the holidays.

You may also consider leaving your entertainment system, such as a radio or television with sound on during this period. Even better is if you can control the unit remotely. Solar will allow that your entertainment system stays on during load shedding, warning would-be criminals that someone might be home.

- **Alarm and sensor systems:** Alarm- and sensor systems could provide you with additional peace of mind by alerting a security company that an intruder may be in your home, while sounding an alarm that could scare off burglars.

Criminals may also see the solar panels on your home's roof and understand that your security system will still be fully operational during load-shedding, deterring them from targeting your home in the first place.

- **Security cameras:** As with the alarm- and sensor system, solar energy can keep your interior and exterior cameras operational throughout the day, allowing you to check in on your home at any time while you're away and, if your cameras are connected to sensors, you can receive a warning on your smart device whenever there's suspicious movement on your premises.

Solar connected cameras will help bring you further peace of mind by allowing you to check in on your home and belongings to make sure they are still safe, allowing you to fully enjoy your time away with family or friends.

- **Internet connectivity:** Lastly, to ensure that all of the previous systems can be controlled remotely while you're away, you will need a consistent internet connection. Solar energy will ensure that your internet router stays active during load shedding, and that all of your smart security devices maintain connectivity.

Once you've made the decision to fortify your home with solar energy, make sure to contact an experienced and well-

established solar provider and installer such as Alumo Energy to visit your home, recommend the right system and pricing model that suits your unique needs, and expertly install your home solar so that no problems arise while you're away or at home using it this holiday season.
