

Developing advanced attribution models for the entire customer journey - online to offline

By [Grant Lapping](#)

7 Dec 2023

Intent-based marketing uses an individual's online data to build targeted messages and encourage consumers who are most likely to buy, but most brands are only just scratching the surface of this marketing.

Source: © 123rf [123rf](#) The evolution of intent-based marketing is developing advanced attribution models to cover the entire customer journey, says Grant Lapping, digital executive +OneX

Despite this, the next step in the evolution of intent-based marketing is about developing advanced attribution models that cover the entire customer journey.

These models not only enable brands to accurately model consumers' online behaviour and attribute credit for conversions to digital channels but also to gain a view of the full funnel across online and offline channels.

They also enable brands to build predictive models on users' intent, in turn helping them to optimise marketing campaigns from exposure to conversion.

Unravelling the attribution path in digital marketing

Attribution modelling tools analyse a user's intent while they browse a website and use these intent signals to attribute credit for conversions to digital channels and predict the likelihood of a person converting.

For example, the attribution modelling tool we work with enables us to classify users as journey A, B, C, D, E or F customers, with journey A representing the highest probability of conversion and journey F the lowest.

This solution tracks 35 buying intent signals from each website visitor, including variables such as time on site, pages viewed, time stamp and previous visits.

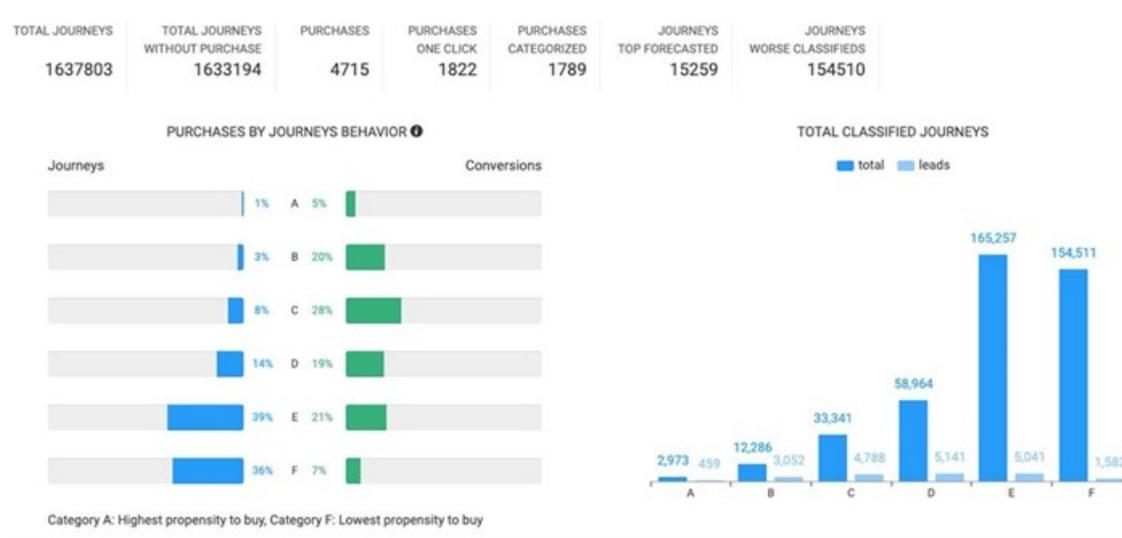

With over 10 years of refining the algorithm, the tool can effectively predict each user's level of buying intent according to their online behaviour. This data empowers marketers with insights to attract more A visitors and fewer F visitors.

The journey A audience segment, for example, might make up one percent of the visits but five percent of the sales.

Journey F visitors could comprise 36% of the site visits but only seven percent of the sales.

Attribution modelling enables us to evaluate each source or campaign to compare where customers on different journeys are coming from.

Importantly, we can see this attribution data in real time.

An example showing how predictive modelling collects intent signals from all users based on their behaviour and groups them into different journey categories.

The solution also allows us to look at each campaign or traffic source and determine which proportion of the traffic it generates is assigned to journeys A to F.

This helps us to optimise campaigns around creative executions, landing pages or user targeting, in turn, allowing us to improve the quality of users based on their intent to convert.

The approach is tailored to getting quick marketing insights that allow for on-the-fly optimisation.

Cost of living hits businesses hard, but good CX could be the saving grace

Moving towards an integrated online and offline marketing ecosystem

As mentioned earlier, one of the most exciting opportunities from this next-generation approach to attribution modelling and intent-based marketing lies in exploiting offline data.

Most brands gather a wealth of customer data from in-store or call centre interactions. This data, housed in their customer relationship management (CRM) systems, is generally excluded from online attribution reporting.

But with today's tools, we can use application programming interfaces (APIs) to map CRM data such as email addresses or telephone numbers to user data from platforms such as Meta, Google or TikTok.

We can export all these contacts and use them to improve marketing efficiency—provided users have opted in to allow their data to be used in this manner.

If we're able to segment prospects in the CRM database according to their propensity to buy, we can empower call centre agents to focus their energies on the customers that are most likely to convert.

We could also feed audience lists into programmatic platforms and use these enriched lists for more effective cross- or upselling.

Another compelling use case is using the list of high-intent users to create lookalike audiences.

With attribution tools maturing and brands starting to harness their power, we are moving towards a Holy Grail in marketing: an integrated view of offline and online customer conversions.

The ultimate goal is to automate data flows across digital marketing, CRM and analytics and attribution platforms.

This enables brands to match offline sales to online leads (and vice versa) and understand the attribution path from first exposure to final sale.

ABOUT GRANT LAPPING

Lapping joined the +OneX team in May 2021 after the company he founded in 2012, DataCore Media, was acquired by +OneX, a new-age solutions and systems integrator. He manages the digital media and marketing team within +OneX. Grant has worked in digital media and strategy since 2005, and has a holistic perspective on the market due to the roles he has held across the agency, client and publisher spectrum
